

## Terminal Description:

Colour	Function	Remark
White	DOOR BELL	Door Bell (Only for MKP-1221)
White	DOOR BELL	
Brown	TAMPER	Once the TAMPER is triggered, there will be a signal transferred to the alarm output
Brown	TAMPER	
Yellow	COM	When the terminals are connected with a magnetic door sensor, the S1 jumper connection should be removed to enable
Green	REED	

## Back View:

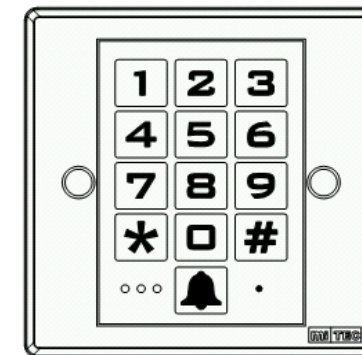

# MKP-1211/1221 User Manual

## Introduction:

MKP-1320 digital keypad is designed for the application with electronic locks, entrance guarding and security systems. With miTECH's latest self-developed IC, data will not be lost in case of power failure.

Aside from the normal keypad functions, MKP-1320 also has some additional functions, such as door monitoring, alarm signal output, tamper resistance and door releasing button input making it a reliable product.

MKP-1320 provides a convenient and automatic way in access management which is especially suitable for offices, apartments and commercial buildings.

**MKP-1211 (Without Door Bell)**  
**MKP-1221 (With Door Bell)**

### **Power Source Input:**

Connecting with AC/DC12V power supply.

### **Door Releasing Button:**

Connecting with a normally opened (N.O.) button to control the Electric Lock Output. The lock will be released as the button is pressed.

### **Magnetic Door Sensor (Reed):**

Connecting with a normally closed (N.C.) magnetic door sensor (Reed). If the door is broken in or is opened for a period longer than the setting time, there will be an alarm.

### **Tamper Button:**

A (N.C.) button locating on the rear for resisting tamper. There will be an alarm as it is activated.

### **Electric Lock Output:**

A transistor output (Max. 24V/2A) with PPTC protection.

### **Door Bell:**

Normally Opened (N.O.) terminals for connecting with a door bell (Max. 24V/100mA) (Only for MKP-1221)

### **LED Indicators:**

- Red: Power Indicator
- Yellow: Program Mode Indicator
- Green: Door Indicator
- 1. Lightened: correct password
- 2. Flash: opened door

## PROGRAMMING SUMMARY

**Program or change the Master Code.** (Default = 1234)

MMMM, MMMM, \*00"code", #      MMMM = Master code  
code = New Master Code (4 to 8 digits)

**Program or change the User Code.** (Default = 01 User 333)

MMMM, MMMM, \*XX,"code", #      XX = Memory No. 01-19  
Code = New User Code (4 to 8 digits)

Or

MMMM, MMMM, \*6YY,"code", #      YY = Memory No.20-99  
code=New User Code(4 to 8 digits)

**Set Lock Output operating time.** (Default = 5 seconds)

MMMM, MMMM, \*20TT, #      TT = 01 to 99 (seconds).  
TT = 00 latch mode

**Delete a User Code.**

MMMM, MMMM, \*50XX, #      XX = Memory No.01-99  
XX = 00 Delete all User Codes and the 01 user with back  
default code.

**Enable/Disable incorrect codes protect.** (Default = disable)

MMMM, MMMM, \*51, #

Note:Enable incorrect codes protect. The System will be locked for 30 seconds after 5 time password incorrect or 20 consecutive incorrect digits to default master code or user code.

**Select incorrect codes protect.** (Default = 20 incorrect digits)

MMMM, MMMM, \*53, 0, #      20 consecutive incorrect digits

MMMM, MMMM, \*53, 1, #      5 time password incorrect

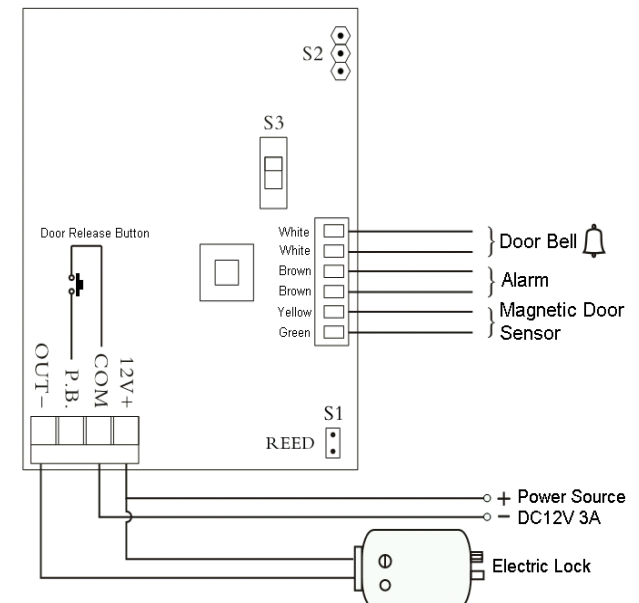

## Wiring Diagram:

(1) Connection with a Electric-Lock Power Supply:

\* For the above connection, the switch S3 should be put to the NO position

(2) Connection with a Electric Lock :

\* For connecting with a fail-secure lock, the switch S3 should be put to the NO position  
For connecting with a fail-safe lock, the switch S3 should be put to the NC position
